                                                                                                                                                                                                                                (PROG-) PROGEN BIOTECHNIK GMBH.

Franke ww, Schaefer S;

RMPI; 97-146518/14.

The present sequence is a segment of carcinoma micrometastases of epithelial or carcinoma cells, not bound to desmosomes, useful for diagnosis and treatment of carcinoma micrometastases of claim 7; Page 5; 8pp; German.

The present sequence is a segment of the desmosomal cadherin (DC), desmoglein Dsg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab) directed against epitopes of the present sequence can be used to diagnose, i.e. to detect carcinoma cells, especially micrometastases, not bound to desmosomes to separate, enrich or detect living or fixed carcinoma cells by cell sorting methods and as a therapeutic to deliver agents, e.g. other Ab or toxins, to metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antibody reactive with part of desmosomal cadherin - exposed on surface of epithelial or carcinoma cells, not bound to desmosomes, you useful for diagnosis and treatment of carcinoma micrometastases of Claim 9; Page 5; 8pp; German.

The present sequence is a segment of the desmosomal cadherin (DC), desmoglein Dsg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab) directed against epitopes of the present sequence can be used to diagnose, i.e. to detect carcinoma cells, especially micrometastases, not bound to desmosomes, to separate, enrich or detect living or fixed carcinoma cells by cell sorting methods and as a therapeutic to deliver agents, e.g. other Ab or toxins, to metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or

Claim 4: Page 31-33; 6lpp: Engilsh.

A cDNA library of PHA-activated peripheral blood mononuclear cells in vector pEF-BOS was screened for interleukin-12 (IL-12) receptor CDNAs by panning. One isolated cDNA (QB3844) encoded a 662-amino acid low affinity IL-12 receptor (R69632). Another cDNA contained an additional 202 bp of 3'UTR; the deduced 660-amino acid sequence (R69633) showed an altered C-terminal sequence compared to R69632. Recombinant IL-12 receptor was expressed in COS cells, and can be sequence 660 AA;

                                                                                                                                                                      N-PSDB; 083844.

DNA encoding a low affinity interleukin-12 receptor - used to bind or scavenge IL-12 to cause immune suppression, e.g. to bind or scavenge IL-12 to cause immune suppression or inflammation, and to treat autoimmune conditions

Claim 4: Page 24-27; 61pp; English.

A cDNA library of PHA-activated peripheral blood mononuclear cells in vector PEF-BOS was screened for interleukin-12 (IL-12) receptor cDNA was sequenced (083844); it encoded a 662-amino acid low affinity IL-12 receptor (R69632); Recombinant IL-12 receptor was expressed in COS cells, and can be used for therapeutic or diagnostic purposes.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Sat May 13 07:16:14 2000; MasPar time 4.29 Seconds 165.096 Million cell updates/sec

Description: Perfect Score: Sequence: >US-08-991-628-4 (1-15) from US08991628.pep 108 1 TPMFLLSRNTGEVRT 15

Title:

Scoring table: PAM 150 Gap 15

Searched: 142080 segs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir62 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 27.219; Variance 35.537; scale 0.766

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

submitted to the EMBL Data Library, February 1994
The biogenesis of C-type cytochromes in Escherichia
requires an integral membrane protein with a prote
disulphide isomerase like domain.

NT This protein is one of a family of glutamine amidotransferases that have dual specificity to utilize either glutamine or ammonia as a substrate. Two functional domains have been identified: an aminator domain, which catalyzes the ammonia dependent reaction, and a glutamine amide transfer domain, which binds glutamine and

                                                                                                                                                                                                                                                                                                                                       C. Natl. Acad. Sci. U.S.A. 88:4796-4800(1991).
FUNCTION: COMPONENT OF INTERCELLULAR DESMOSME JUNCTIONS.
INVOLVED IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEL
FILAMENTS MEDIATING CELL-CELL ADHESION.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EPIDERMIS, TONGUE, TONSILAND ESOPHAGUS.
DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE REPEATS
                                                                                                                                                                                                                                                                                           (POTENTIAL).
SIMILARITY: BELONGS TO THE CADHERIN FAMILY. DESMOSOMAL SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TPMFLLSRNTGEVRT

"Specific thiol compounds complement deficiency in c-type propertion of the compounds complement deficiency in a membrane-bound disulphide isomerase-like protein.";

Leter 135:235-238 (1994).

C-!- FUNCTION: REQUIRED FOR DISULFIDE BOND FORMATION IN SOM PERIPLASMIC PROTEINS. ONE OF ITS FUNCTION COULD BE TO THE CYS RESIDUES IN APOCYTOCHROMES C IN A REDUCED STAT COVALENT LINKAGE WITH THE HEME.

C-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER COLLOWER STATES AND CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTROL OF THE CONTR

P SEQUENCE OF 1-83 FROM N.A.

C STRAIN-CV: FELTHAM FIRST;
A Ngai N., Tsai F.Y., CORUZZI G.M.;
T Night 'Induced transcriptional repression of the pea AS1 gene
1 deptification of cis-elements and transfactors.";
Submitted (MAY-1997) to the EMBL/GenBank/DDBJ databases.
C :- CATALYTIC ACTIVITY: ATP + L-ASPARRATE + L-GLUTAMINE - AMP
PYROPHOSPHATE + L-ASPARAGINE + L-GLUTAMATE.
C :- PATHMAY: ASPARAGINE BIOSYNTHESIS.
C :- INDUCTION: DARK-INDUCED.
C :- SIMILARITY: THE GATASE DOMAIN BELONGS TO TYPE-2 GLUTAMINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ASN2_PEA STANDARD; PRT; 582 AA. "Metabolic regulation of the gene encoding glutamine-dependent asparagine synthetase in Arabidopsis thaliana.";

Plant Physiol. 106:1347-1357(1994).

-i-CARALYTIC ACTIVITY: ATP + L-ASPARTATE + L-GLUTAMINE - AMP - PYROPHOSPHATE + L-ASPARAGINE + L-GLUTAMATE.

-i-PARHWAY: ASPARAGINE BIOSYNTHESIS.

-i-SIMILARITY: THE GATASE DOMAIN BELONGS TO TYPE-2 GLUTAMINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  INIT_MET

The proteins sequence is the pemphigus vulgaris 130kD antigen. The proteins sequence is the pemphigus vulgaris and the ancoding DNA may be used in the diagnosis and treatment (pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule. Sequence 999 AA;

Claim 1; Page 7-9; 9pp; Japanese.

W07908 represents the human pemphigus vulgaris (PV) antigen with w07908 represents the purpose of sa rare extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare pemphis vulgaris resulting in autoimmune pemphigus vulgaris resulting in suprabasal, intra-epidermal bullae relapsing disease causing suprabasal, intra-epidermal bullae relapsing disease causing suprabasal, intra-epidermal bullae if relapsing disease causing suprabasal to a human IgG1 hinge region untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.

pr pemphigus foliaceus antigen-IgG constant region fusion protein - linked premphigus foliaceus antigen-IgG constant region fusion protein - linked premphigus foliaceus protein (12: 17pp: Japanese.)

Claim 1: page 10-12: 17pp: Japanese.

CC This sequence represents a fused protein recognised by pemphigus constant region of pemphigus foliaceus patient autoantibody which comprises the constant region of foliaceus foliaceus foliaceus is constant region of pemphigus foliaceus is constant region of pemphigus foliaceus is constant furough the hange portion. Pemphigus foliaceus is constant yen protein through the hange portion seminar fusion constant yen protein fusion recognised by generalised, vesicular and scaling skin eruption similar constant yengent is nested to dermatitis herpetiformis. The pemphigus foliaceus antigen is protein is useful to treat pemphigus foliaceus. The antigen constant is useful to treat pemphigus foliaceus which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful construction is defects.

CC useful for detecting pemphigus foliaceus antibodies which is useful constant yengent y

PT Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat projuccleotide(s) encoding human protocadherins pc3 and pc4 and rat projuccleotide(s) encoding human protocadherins pc3 and pc4 and rat projuccleotide(s) encoding human protocadherin pc3 involved in cell-cell pc3 cellaim 15; page 115-119; 146pp; English.

PS R8685-R86867 represent the sequences for three protocadherins are cc sequence represents the human protocadherin pc3 in these sequences are cc sequence represents the human protocadherin pc3 in vell-cell cc related to cadherin, and possess cell adhesive ability. Cadherins are composed of an N-terminal extracellular domain complete composed of an N-terminal extracellular domain, and a macherine spanning domain, and a cc adherinal cytoplasmic domain. The cytoplasmic domain interacts with the cytoskeleton through catenins and other cytoskeleton associated proteins. Cc cytoskeleton through catenins and other cytoskeleton associated proteins. Cc which possess it, it is essential for the cadherins adhesive function. Cc which possess it, it is essential for the cadherins adhesive function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25-MAR-1997.

pr through, the gastrointestinal tract, e.g. insulin or leuprolide
PS Disclosure; Fig 2: 294pp; English.

CC This sequence is the human HPT-1 protein. The invention relates to
CC purified proteins (I) that bind specifically to at least one of the
CC gastro-intestinal (GI) tract receptors human intestinal
CC peptide-associated transporter (HPTI), hPEPTI, D2H and human
CC sucrose-isomaltase complex (hSI). (I) provide active transport of
CC therapeutic agents through human and animal GI tissue (into the blood)
CC for in vivo delivery, particularly for treatment or prevention
CC of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer,
CC insulin or leuprolide, but many other suitable therapeutic agents are
CC disclosed, including genes or inhibitory nucleic acid, imaging agents and
CC antigens. (I) may also provide targeting to the GI tract. Other uses of
CC (in a binding assay); and (ii) to screen for molecules that bind (I).
CC Immunogenic analogues or derivatives of (I) are used to raise antibodies
CC and in immunoassays. The antibodies are used to locate, detect and
CC measure (I), e.g. for imaging, monitoring treatment, tissue analysis
CC etc., also for peptide purification and immobilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ភពពិ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     function via a different method from those with a cytoplasmic domain. These sequences were isolated using primers 1 and 2 (see T03575 and T03576) The proteins may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadhering, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New proteins that bind specifically to receptors in the gastro-intestinal tract and related nucleic acid - chimaeras antibodies, used to deliver therapeutic or diagnostic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protocadherins, an Sequence 787 AA;
